

PALLET LIFT

Reciprocating Pallet Lift

The *PALLET LIFT* from Vertical Systems, Inc., is an electric reciprocating pallet lift. It is an economical alternative to continuous vertical lifts when low rates per minute are needed, but require a dependable heavy duty high cycle lift.

The *PALLET LIFT* uses an all-mechanical lifting mechanism with dual wire rope cables for safety, which makes the unit easier to maintain than hydraulic lifts and reduces the handling and disposal of hazardous oils. The *PALLET LIFT* is capable of "Z" pattern, "C" pattern and "90 Degree" pattern material flow.

A complete control panel to control all machine functions for automatic and manual operations is standard and can be designed to control other conveyors.
